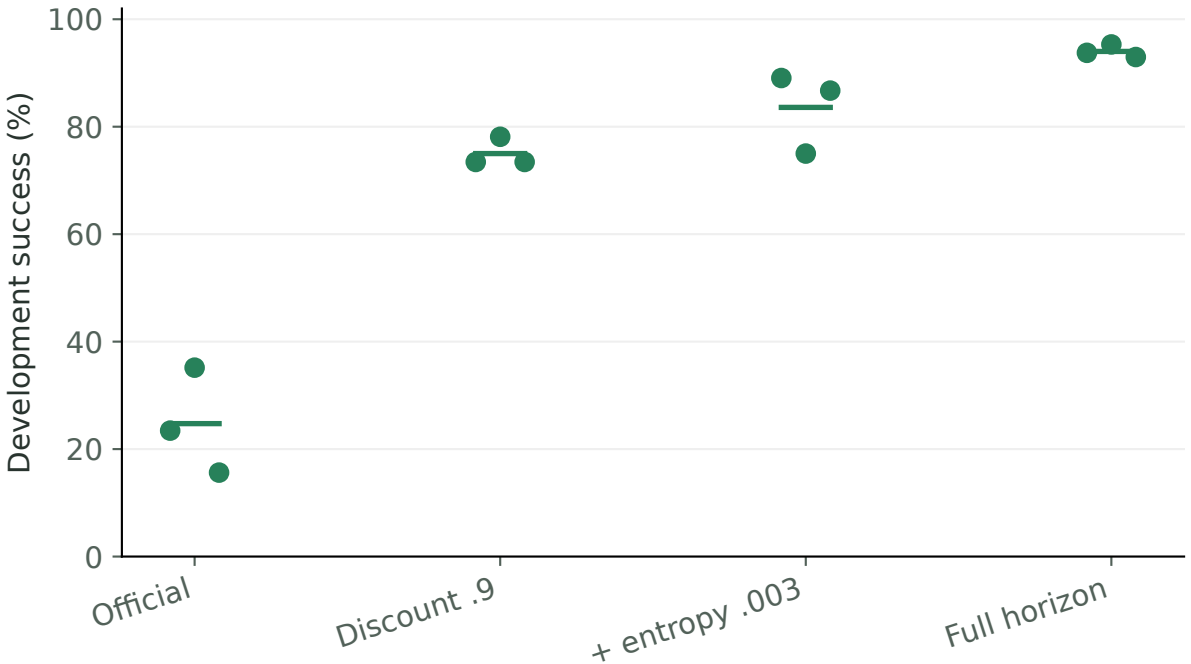
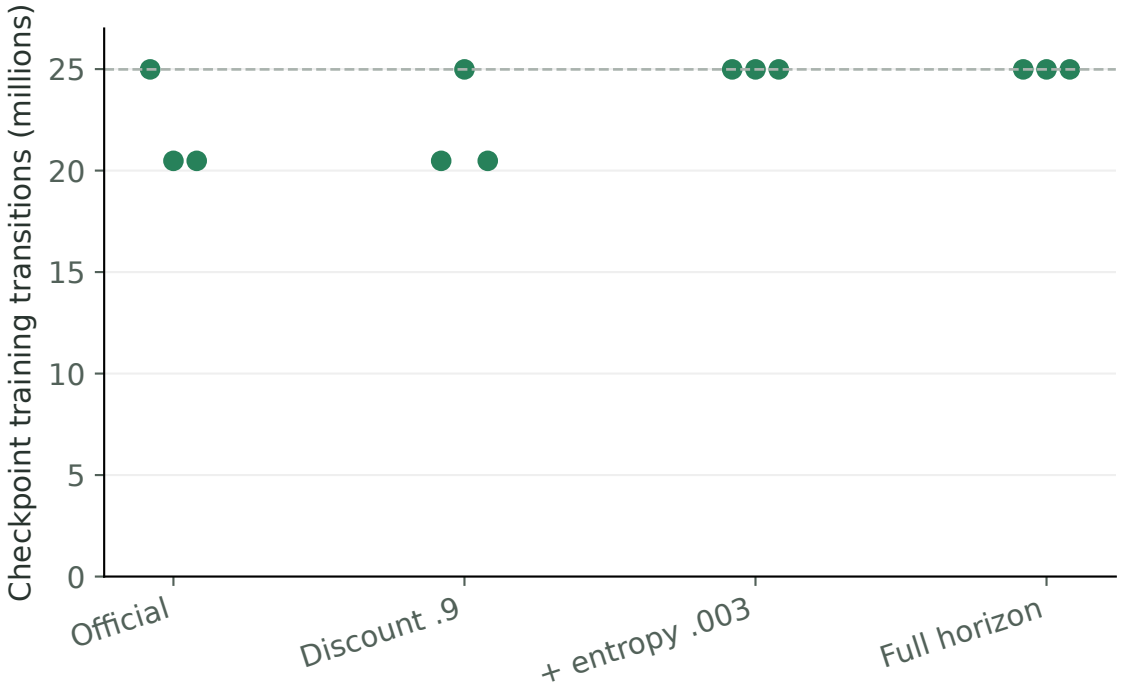
What the existing checkpoints say about a 22-minute limit

Latest eligible scored checkpoint across equivalent recipe records by 1,320 training seconds; steps can differ.





Each dot is one training seed. Left-panel strokes show three-seed means at the available snapshots, not equal-step comparisons.
Intermediate times use logged update timestamps; final times use measured trainer duration. No claim of an exact 22-minute score.
Entropy uses timed-control reruns with identical actor digests (1,280–1,299s); these are the same policies, not extra independent seeds.
Entropy and full horizon reached 24.99M steps within the limit for all 3 seeds; official and discount-only still mix checkpoint steps.
